

RESULTS

The quantitative results shown in the table below have been normalised to 100 %, and the values shown represent the relative proportion of the crystalline material in the sample. Totals greater or smaller than 100 % are due to rounding errors.

Results in the table preceded by an asterisk indicate normally a larger than usual uncertainty in regard to the quantity of the phase reported; for some of the minor and trace phases it might also indicate an uncertainty in regard of the phase itself, or both.

Mineral or mineral group	Sample 1
	Meta-kaolin
	Mass %
Kaolinite	33
Serpentine	1
Chlorite	2
Annite - biotite - phlogopite	1
Muscovite	1
Quartz	62

COMMENTS

The sample might contain a trace amount of plagioclase.

A trace amount of anatase might be present.

Some amorphous material is likely present.
